**CASES**

Must be isolated for a minimum of 10 days after onset and can be released after afebrile and feeling well (without fever-reducing medication) for at least 72 hours, whichever is longer.

*Note: Lingering cough should not prevent a case from being released from isolation.*

**Examples:**
- A case that is well on day 2, and afebrile and feeling well for 72 hours, can be released from isolation on day 10.
- A case that is well on day 6, and afebrile and feeling well for 72 hours, can be released from isolation on day 10.
- A case that is well on day 14, and afebrile and feeling well for 72 hours, can be released from isolation on day 17.

---

**HOUSEHOLD CONTACTS**

Must be quarantined for 14 days after the case has been afebrile and feeling well (because exposure is considered ongoing within the house).

If a household contact develops symptoms, they should be tested.

*This means that household contacts may need to remain at home longer than the initial case.*

**Examples:**
- A case is well 3 days after onset. The household contact must remain quarantined until day 24.
- A case is well 7 days after onset. The household contact can be released on day 24.
- A case is well 14 days after onset. The household contact can be released on day 31.

---

**NON-HOUSEHOLD CONTACTS**

Must be quarantined for 14 days from the date of last contact with the case.
